Playing the Game

4 Seting up a Game

4.1 Distributing the Point Sticks

At the beginning of the game, each player will have a total of 25,000 points. These are counted using point sticks. Below is the recommended distribution, however it can vary so long as the total value of the point sticks is 25,000.

Figure 1: Recommended point stick distribution.

4.2 Drawing for Seats

After distribution of point sticks, the seating order of the players must now be determined. There are many ways to do this, three are detailed below. All of these require that you set aside the tiles East, South, West, and North.

Direct Draw

For this draw method, you will only need East, South, West, and North.

1. A player will shuffle all four of the tiles face down.
2. Every other player will draw a tile, leaving the last one to the player who shuffled them.

3. Each player will take the seat as dictated by their wind, allowing East to choose their seat first. They will be the dealer.

Traditional Draw

For this draw method, you will need a 1 and a 2 in addition to East, South, West, and North. This method requires everyone to be seated.

1. A player will shuffle all six of the tiles face down. Then they will roll both dice.
2. Counting counter-clockwise, starting from themselves, the player indicated by the dice will be Temporary East.
3. Temporary East will reveal the tiles and move the numbered tiles outwards to opposite edges.
4. If the dice roll in step 1 is odd, they will start drawing from the direction of the tile numbered 1. Otherwise they will start drawing from the direction of the tile numbered 2.
5. Distribute the tiles to each player in the order the tiles are in. Then rearrange the players so that they are seated in the correct order for the winds.
6. Lastly the Temporary East player will roll the dice one final time to determine the dealer to start the game.

Dealer Only Draw

For this draw method, you will only need East, South, West, and North. This method works best while everyone is seated already.

1. A player will shuffle all four of the tiles face down.
2. Every other player will draw a tile, leaving the last one to the player who shuffled them.
3. Whoever draws East will be the dealer, no one needs to move.

5 Setting up a Hand

5.1 Breaking the Wall

At the beginning of every hand, the dealer will roll two six-sided dice. This determines precisely where to break the wall. Firstly, count counterclockwise wall by wall starting from the dealer's wall. Then, upon counting to the value on the dice, break the wall that many tiles from the right of that wall.

For example, on the most common roll of a seven. You will count until you get to the West player's wall. After which you will break it seven from the right.

5.2 Distributing the Tiles

After breaking the wall, it is time to distribute the tiles to the players. Starting from the dealer, they will draw four tiles. Specifically a 2×2 block of tiles. After which the player to their right will grab the next 2×2 block. This continues until everyone has twelve tiles in their hand. After which, each player in turn order will draw one tile. Lastly, the dealer draws their normal draw to start their turn off.

The dealer may draw their thirteenth and fourteenth tiles together in a sort of jump draw, however that is nothing more than a shortcut for the above procedure.

5.3 Setting up the Dead Wall

After the tiles are distributed, the player whose wall was broken should set up the dead wall. This lies on the other side of the break. Flip the top tile of the third stack in face up. This is the Dora indicator. We deliberately leave four and only four tiles to the left of the Dora indicator for replacement draws for calling Kans ($p??/??$). Additionally, place the top tile of the leftmost stack to the left of the bottom tile of the same stack. This is done to avoid it getting knocked over so people will have an easier time earning the Rinshan Kaihou yaku ($p13$).

6 Gameplay

6.1 Taking a Turn

To start your turn, you will draw the next tile in the live wall, then you will choose and discard a tile from your hand. There are many things that can happen during your turn to modify this, and they will be detailed further below.

6.2 Calling for a Group

As a tile is being discarded, you can call for a group using that tile. There are three types of calls:

Chii – 吃^{チー} “*Calling for a Run*”

!! *Only from the player before you*

× *Superceded by Pon (p??), Kan (p??), Ron (p??)*

As a tile is discarded, if it was discarded by the player before you in turn order, you can call “Chii”. Reveal two tiles from your hand that form a run with the discarded tile, then discard a tile from your hand.

6.3 Declaring Riichi

6.4 Declaring a Win

6.5 Exhaustive Draw

Scoring

7 Scoring

7.1 Paying out a Winning Hand

In order to pay out a winning hand, follow the following procedure:

1. Count the Han earned from Yaku 8, and Bonuses 9.1.
2. If that number is 4 or lower, count the Fu 10 the hand earns. Round that to the next 10, with the exception of hands winning with Chi-itoitsu (*p14*), that hand is always worth 25 fu.

After determining the Han, and if needed Fu, consult the table in Figure 2 to determine the score. Taking into account Dealer or Non-dealer, Ron or Tsumo. Note that the third column is what is paid by all for a dealer Tsumo.

Han				Non-dealer		Dealer

7.2 End of Game Scores

At the end of the game, you will convert your scores to what will be called Match Points. Then you will apply bonuses and/or penalties based on your placement in the game. This gets the final match score that you will carry with you to your next game in the series.

The procedure for doing it is as follows:

1. Subtract your ending score from 30,000. This 30,000 is called the Return Score.
2. Then divide the resulting value by 1,000.
3. Then apply the Placement Bonus, also called Uma. In this case, it is $+30/+10/-10/-30$.
4. Then apply the First Bonus, also called Oka. It is calculated as $\frac{4 \times (\text{Return Score} - \text{Start Score})}{1,000}$, in this ruleset that is $+20$. As the name suggests, this applies only to first place.

To aid in this process, an additional match scoresheet is attached in Figure 7.2. It is recommended to use it for tabulating score after each Game to determine a winner in a four game series.

To give an example of the above procedure:

- A game ended with the scoreline of:
41,300, 24,900, 21,800, 12,000
- After paying back the return score it becomes:
11,300, ▲5,100, ▲8,200, ▲18,000
- Dividing by 1,000 becomes:
11.3, ▲5.1, ▲8.2, ▲18.0
- Adding the Uma:
41.3, 4.9, ▲18.2, ▲48.0
- Then the Oka:
61.3, 4.9, ▲18.2, ▲48.0
